FINAL EXAMINATION

TRIMESTER 1, 2017/2018

TDS2201 – STATISTICAL DATA ANALYSIS
(All sections / Groups)

11 OCTOBER 2017
9 am – 11 am
(2 Hours)

INSTRUCTION TO STUDENT

1. This question paper consists of 15 printed pages (inclusive of the front page) with 4 questions only. A formula sheet and statistical tables are attached (pages 9 – 15).

2. Attempt **ALL** 4 questions. The distribution of the marks for each question is given.

3. Please write your student ID in the space at the top right corner on this front page.

4. Please write all your answers in the space provided for each question in this question paper.

5. Show **ALL** of your working steps clearly.

TRIMESTER 1, 2017/2018

TDS2201 – STATISTICAL DATA ANALYSIS
(All sections / Groups)

11 OCTOBER 2017
9 am – 11 am
(2 Hours)

INSTRUCTION TO STUDENT

1. This question paper consists of 15 printed pages (inclusive of the front page) with 4 questions only. A formula sheet and statistical tables are attached (pages 9 – 15).

2. Attempt **ALL** 4 questions. The distribution of the marks for each question is given.

3. Please write your student ID in the space at the top right corner on this front page.

4. Please write all your answers in the space provided for each question in this question paper.

5. Show **ALL** of your working steps clearly.

QUESTION 1 **[16 marks]**

Scientists examined a new drug for advanced lung cancer in a mouse model. One random group of 10 mice had gene therapy treatment that was delivered directly into the tumour. The other group of 10 mice had only a buffer solution injected into the tumours. The data below for each individual in the groups give the factor by which the tumour increased in size after 2 weeks. Round up all your intermediate or final values to at most two decimal places for all the questions below.

Buffer solution	4.1	2.8	2.3	5.4	7.9	15.2	7.9	7.6	10.1	7.8
Gene therapy	1.9	1.5	2.1	0.3	1.9	2.1	3.4	1.8	3.0	2.1

a) Determine the five number summaries of each of these two data sets.

Buffer solution:

Gene therapy:

b) Identify if there is any outliers in each of these two data sets. Show your working.

Buffer solution:

Gene therapy:

Continued ....

c) Calculate the mean for Gene therapy. Comment on the skewness of the distribution of this data set by comparing the mean to the median.

d) Calculate a 95% confidence interval for the difference in the mean growth factor between the two treatment groups (assume equal variance). Show your working.

e) Based on the above confidence interval, is there sufficient evidence to conclude that the treatments do differ in their effects on the tumours? Explain your answer?

Continued ......

QUESTION 2 **[8 marks]**

A soft-drink machine at a steak house is regulated so that the amount of drink dispensed is approximately normally distributed with a mean of 200 millilitres and a standard deviation of 15 millilitres. The machine is checked periodically by taking a sample of 9 drinks and computing the average content. If sample mean falls in the interval (191, 209), the machine is thought to be operating satisfactorily; otherwise, we conclude that true mean is not equal to 200 millilitres.

a) Find the probability of committing a type I error.

b) Find the probability of committing a type II error if the true mean is 216 millilitres.

Continued ....

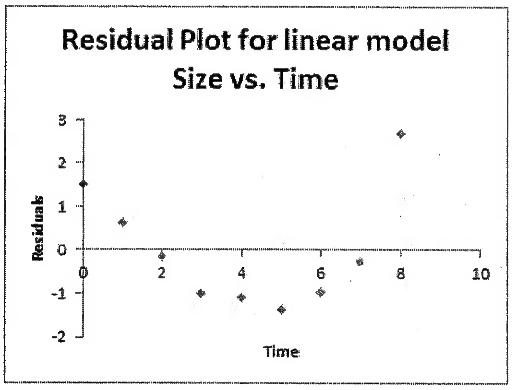
c) What is the power of the test if the true mean is 216 millilitres?

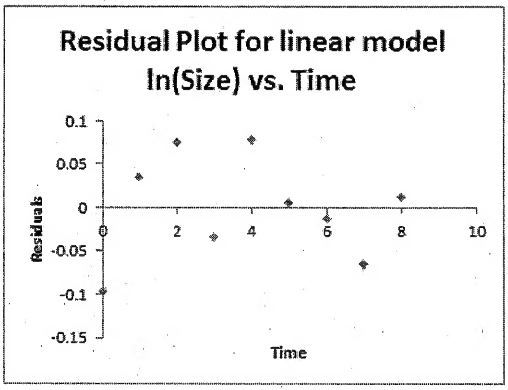
QUESTION 3 [8 marks]

Biologists were studying a fast-growing organism by following its size with time. The size (mm), was measured each day at the same time for 8 days. The data below shows this diameter size in mm with the days passed:

Time (days)	0	1	2	3	4	5	6	7	8
Size (mm)	0.75	1.20	1.75	2.20	3.45	4.50	6.20	8.25	12.50
ln(Size)	-0.29	0.18	0.56	0.79	1.24	1.50	1.82	2.11	2.53

To determine the best fit linear model for size as a function of time, the following residual plots were produced after fitting linear model for Size vs. Time and ln(Size) vs. Time (ln(Size) is the value of logarithms to base e for Size).





a) Which of the linear models is a better fit for this set of data? Explain your answer.

Continued ....

b) By referring to your answer in part (a), fit the linear model. You must write your model with size as a function of time (perform transformation in your equation if necessary).

c) Using your model in part (b), predicted the size of the organism at day 7. Calculate the residual of the organism size at day 7.

d) Describe the association between the size and time.

Continued ....

QUESTION 4 **[8 marks]**

A social scientist wants to conduct a test of significance to determine if there is any association between an engineering graduate's grade point average (low, average, high) and starting salary (low, high). A sample of ninety graduating engineers were collected and classified into the following contingency table:

	Grade Point Average (GPA)		
Starting salary	Low	Average	High
Low	15	18	7
High	5	22	23

a) Write down the corresponding null and alternative hypothesis.

b) Fill the expected count into the table below. You can leave your answer as a fraction or in two decimal points.

	Grade Point Average (GPA)		
Starting salary	Low	Average	High
Low			
High			

c) Calculate the appropriate test statistic. Show all your working steps clearly.

Continued ....

d) What is the meaning of p-value?

e) Find the p-value for this test.

f) What is the conclusion of the test if the level of significant is 0.01? Explain your answer.

End of Page.

Formula Sheet

Confidence Interval

1) $\bar{x} \pm Z_{\alpha/2} \frac{\sigma}{\sqrt{n}}$

2) $\bar{x} \pm t_{\alpha/2,\, n-1} \frac{s}{\sqrt{n}}$

3) $(\bar{x}_1 - \bar{x}_2) \pm Z_{\alpha/2} \sqrt{\frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2}}$

4) $(\bar{x}_1 - \bar{x}_2) \pm t_{\alpha/2, n_1+n_2-2} \times s_p \sqrt{\frac{1}{n_1} + \frac{1}{n_2}}, \quad s_p^2 = \frac{(n_1-1)s_1^2 + (n_2-1)s_2^2}{n_1+n_2-2}$

5) $(\bar{x}_1 - \bar{x}_2) \pm t_{\alpha/2,\nu} \sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}, \quad w_i = \frac{s_i^2}{n_i}, \quad \nu = \frac{(w_1 + w_2)^2}{\frac{w_1^2}{n_1 - 1} + \frac{w_2^2}{n_2 - 1}}$

5) $\hat{p} \pm Z_{\alpha/2} \sqrt{\frac{\hat{p}\hat{q}}{n}}$

6) $(\hat{p}_1 - \hat{p}_2) \pm Z_{\alpha/2} \sqrt{\frac{\hat{p}_1\hat{q}_1}{n_1} + \frac{\hat{p}_2\hat{q}_2}{n_2}}$

7) $\frac{(n-1)s^2}{\chi^2_{\alpha/2,n-1}} < \sigma^2 < \frac{(n-1)s^2}{\chi^2_{1-\alpha/2,n-1}}$

8) $\frac{s_1^2}{s_2^2} \cdot \frac{1}{f_{\alpha/2,\, \nu_1,\, \nu_2}} < \frac{\sigma_1^2}{\sigma_2^2} < \frac{s_1^2}{s_2^2} \cdot f_{\alpha/2,\, \nu_2,\, \nu_1}$

Test of significance

1) $\text{Test statistic} = \frac{\text{sample estimate - null value}}{\text{standard deviation of sample estimate}}$

2) $X^2 = \sum\sum \frac{(O_{ij} - E_{ij})^2}{E_{ij}}$
